2019-nCoV

ANTIGEN RAPID TEST CASSETTE

INTENDED USE

The 2019-nCoV Antigen Rapid Test Cassette is a lateral flow immunoassay intended for the qualitative detection 2019-nCoV nucleocapsid antigens in anterior nasal swab. This test cassette can be used for self-testing.

medical diagnoable healthy

BENEFITS

- Rapid testing for SARS-CoV-2 antigen within 15 minutes
- Facilitates patient treatment decisions quickly
- Anterior nasal swab, time-saving procedure
- All necessary reagents provided & no equipment needed
- High sensitivity and specificity

Applicable Samples: anterior nasal swab.

Packing Specification

1 tests/kit	5 tests/kit	10 tests/kit	20 tests/kit	30 tests/kit

Main components

Test Cassette	Sterilized Swab	Positive Control（If required）
Extraction Tube	Extraction Reagent	Negative control（If required）

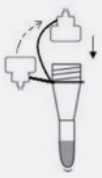
Test Method

◎ Please open the extraction reagent and drop all the liquid into the extraction tube.

◎ Put the swab into one nostril. The swab tip should be inserted no less than 2.5 cm (1 inch) from the edge of the nostril. Roll swab at least 3 times along the mucosa inside the nostril. Leave swab in the nostril for several seconds. Using the same swab, repeat this process for the other nostril. Withdraw swab from the nasal cavity. Caution: This may feel uncomfortable. Do not insert the swab any deeper if you feel strong resistance or pain.

◎ Insert the swab into the extraction tube which contains the extraction reagent. Rotate the swab inside the tube using a circular motion to roll the side of the extraction tube so that the solution is expressed and reabsorbed from the swab. Pinch the extraction tube with fingers and elute the liquid on the swab as far as possible into the extraction reagent, then pull out the swab. The extracted solution will be used as test specimen.

◎ Buckle the dripper



◎ Reverse the specimen extraction tube, holding the specimen extraction tube upright，add 3 drops (about 90μL) of the sample to be tested into the sample hole. Wait for colored lined to appear

◎ Wait for colored lines to appear. Interpret the test results at 15 minutes. Do not read results after 20 minutes.

ABT

STATEMENT ON THE OMICRON VARIANT

We have been continuously monitoring the emergence of **SARS-CoV-2** variants and the Omicron variant is no exception.

The Omicron variant is notable for the significant number of mutations in the Spike protein. Those mutations are not relevant to the **SARS-CoV-2 Antigen Rapid Test Cassette,**which detects the SARS-CoV-2 Nucleocapsid protein.

According to the GISAID analysis and the pairwise sequence alignment comparison of the Nucleocapsid protein from all of the tested variants (B.1.351, B.1.1.7, P.1, and Delta variant B.1.617.2), there is a high likelihood that the SARS-CoV-2 Omicron variant (lineage B.1.1.529) is detectable by the **SARS-CoV-2 Antigen Rapid Test Cassette.**

We anticipate testing virus samples, once they become available to us, to further verify the performance of our test in detecting the Omicron variant.

Furthermore, X-ABT will continue to monitor the evolution of **SARS-CoV-2** variants in circulation worldwide and evaluate the performance of our assays against Omicron and future variants to maintain the high level of product performance our customers have come to rely upon.

Supplement Clinical Evaluation Report for SARS-CoV-2 Antigen Rapid Test Cassette Anterior Nasal Swab

(Original name: 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab)

Company: Beijing Applied Biological Technologies Co., Ltd

Researchers	Title	Take responsibility
Ewelina Szpak mgr	Operator:	Test implementation, collect samples， report drafting
Paweł Chrzan PhD	Reviewer:	Report reviewing and approval

1. Summary

This trial is as the additional test for the first submission after the regulation updated and supply for the supplement request.

The first trial was conducted by Centralne Laboratorium Kliniczne Uniwersyteckie Centrum Kliniczne (University Clinical Center) from 2021-06-24 to 2021-07-06. In the first trial, anterior nasal swab samples from confirmed or suspected cases of viral pneumonia were enrolled for study, and a total of 440 valid samples were tested.

The second trial was conducted by Centralne Laboratorium Kliniczne Uniwersyteckie Centrum Kliniczne (University Clinical Center) from 2021-08-10 to 2021-09-20. In the second trial, anterior nasal swab samples from confirmed or suspected cases of viral pneumonia were enrolled for study, and a additional 270 valid samples were tested.

During the two trials, total of 710 samples were tested.

A total of 710 subjects were enrolled in this trial, including 347 males and 363 females, a total of 710 samples were detected in this trial. 240 cases were positive and 470 cases were negative. The positive consistent rate is 95.83%(Detection of >80%) and the negative consistent rate is 100.00%(Specificity >98%). Total consistent rate is 98.59 %.

2. Propose :

In first submission(Attachment 1), we completed total 220 positive and 220 negative samples. According to the new regulation MDCG 2021-21, which issued on August 2021, the new regulation increased the negative from total 220 to total 450 negative samples, include 300 non-infected individuals, 100 hospitalised patients and 50 potentially interfering and cross-reactive samples: including virus-positive samples of endemic human coronaviruses 229E, OC43, NL63, HKU1; influenza A, B, RSV, and other pathogens of respiratory diseases, eligible for differential diagnosis; including bacteria present in the sampling area.

To satisfy the new regulation, we provide additional total 250 negative samples, include 100 non-infected individuals, 100 hospitalised patients and 50 potentially interfering and cross-reactive samples.

And also, to monitor new emerging mutants of the virus, we tested additional 20 positive for the delta subtype samples to obtain the test result. Please check the Table 1 for more information.

Table 1: Summary of the count samples for the first submission and second submission

Requirement	Provide
100 Positive specimens	First submission ： 220 positive Second submission： 20 positive（delta） Total： 240 positive
300 Negative specimens from non-infected individuals	First submission ： 220 negative specimens from non-infected individuals Second submission： 100 negative specimens from non-infected individuals Total： 320 negative
100 Negative specimens from hospitalised patients	Second submission： 100 Negative specimens from hospitalised patients

50 Negative specimens Potentially interfering and cross-reactive samples	Second submission: 50 Negative specimens potentially interfering and cross-reactive samples

3. Materials for the Study

Investigational reagent: 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab
Manufacture: Beijing Applied Biological Technologies Co., Ltd.
Comparison reagent: Vitassay qPCR SARS-CoV-2 CE-approved
Manufacturer: Vitassay Healthcare S.L.U.

Product name	Manufacturer	Lot No.	Expiry date
2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab	XABT	E20210821	2023-08-14
Vitassay qPCR SARS-CoV-2	Vitassay Healthcare S.L.U.	11046-448	2023-05-31
Nucleic acid extraction Kit	GeneProof crobee 201A	2027617	2022-03

4. Clinical Results and Analysis

4.1 Basic characteristics of subjects

A total of 710 subjects were enrolled in the two trials, including 347males and 363 females. The result for the investigational reagents shows total 230 positive and 480 negative in these two trails. The specific results are shown in below table.

Table 2 Basic information of subjects

Observation indicators	**Amount**	**Positive Numbers**	**Negative Numbers**
Gender	710	230	480
Male	347	115	232
Female	363	115	248
Age, (Years old)	**Amount**	**Positive Numbers**	**Negative Numbers**
< 1Y	7	0	7
1-10Y (including 10)	58	4	54
11-20Y (including 20)	95	11	84
21-30Y (including 30)	96	44	52
31-40Y (including 40)	88	43	45
41-50Y (including 50)	117	50	67
51-60Y (including 60)	79	31	48
61-70Y (including 70)	101	31	70
71-80Y (including 80)	40	7	33
81 -90Y (including 90)	27	7	20

>90Y	2	2	0
Minimum - maximum	0-94 years old		

710	230	480

4.2 Clinical evaluation results

Requirement	Acceptance criteria
Positive specimens	Detection of >80% (rapid tests);
Negative specimens	Specificity >98% (rapid tests)

Refer to: MDCG 2021-21 Guidance on performance evaluation of SARS-CoV-2 invitro diagnostic medical(Page 11)

Total 710 samples were tested. The result showed in below table.

The positive consistent rate is 95.83%(Detection of >80%) and the negative consistent rate is 100.00%(Specificity >98%). Total consistent rate is 98.59 %.

Table 3: Test Group Divided by Ct Value

Group	Ct of ORF gene	Amounts of samples
High/Medium Positive	Ct<25	167
Medium/Low Positive	25<Ct<30	51
Low Positive	Ct>30	22
Negative	Not detected.	470

Table 4: Result Analysis

Investigational Reagent		Comparison reagent		total
		Positive	Negative	
2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab	Positive	230	0	230
	Negative	10	470	480
total		240	470	710

The evaluated reagent detection results are as follows:

Positive consistent rate = 95.83% (92.47%～97.98%)*

Negative consistent rate = 100.00% (99.22%～100.00%)*

Total consistent rate = 98.59% (97.43%～99.32%)*

*95% Confidence Interval

Kappa value = 0.968, indicating that the evaluated reagent detection results and the comparison results were in good consistency.

5. Study Conclusion

In summary, the 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab has shown satisfying sensitivity, specificity, and total accuracy in the present evaluation. It can be used as a rapid tool to assist the early diagnosis of COVID-19 cases.

Table of Contents

Abstract

1. Summary

2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab produced by Beijing Applied Biological Technologies Co., Ltd. as the investigational reagent, The trial was conductedCentralne Laboratorium Kliniczne Uniwersyteckie Centrum Kliniczne (University Clinical Center) from2021-06-24 to 2021-07-06. In this trial, anterior nasal swab samples from confirmed or suspected cases of viral pneumonia were enrolled for study, and a total of 440 valid samples were tested.

A total of 440 subjects were enrolled in this trial, including 203 males and 237 females, a total of 440 samples were detected in this trial. 220 cases were positive and 220 cases were negative.

Results: the 440 samples included 220 of positive samples, and 220 negative samples. Statistical analysis: the sensitivity of the investigational reagent detection results was 95.45% (91.80%-97.80%), the clinical specificity was 100.00% (98.34%-100.00%), and the total coincidence rate was 97.73% (95.86%-98.90%), that is, the investigational reagent detection results and the comparison results were in good consistency.

1.Product Information

1.1 Intended Use

2019-nCoV nucleocapsid antigen is generally detectable in anterior nasal swab during the acute phase of infection(within seven days after symptoms appeared). Positive results indicate the presence of viral antigens, but clinical correlation with patient history and other diagnostic information is necessary to determine infection status. Positive results do not rule out bacterial infection or co-infection with other viruses.

Negative results do not rule out 2019-nCoV infection and should not be used as the sole basis for treatment or patient management decisions, including infection control decisions. Negative results should be considered in the context of a patient's recent exposures, history and the presence of clinical signs and symptoms consistent with 2019-nCoV, the test results of this kit are only for clinical reference.The 2019-nCoV Antigen Rapid Test Cassette is only used as an auxiliary diagnosis, not as a basis for clinical diagnosis.

1.2 Test Principle

The test is based on the specific antibody-antigen reaction and immunoanalysis technology to detect 2019-nCoV antigen from anterior nasal swab specimens. During testing, a specimen migrates upward by capillary action. The 2019-nCoV antigens if present in the specimen will bind to the antibody conjugates. The immune complex is then captured on the membrane by the pre-coated 2019-nCoV nuclenocapsid protein monoclonal antibody, and a visible colored line will show up in the test line region indicating a positive result. In the absence of 2019-nCoV antigens, a colored line will not form in the test line region indicating a negative result.

To serve as a procedural control, a colored line will always appear at the control line region, indicating that proper volume of specimen has been added and membrane siphoning has occurred.

1.3 Product Storage

Storage conditions and expiration date: The kit should be stored at 2-30℃, and is valid provisionally for 24 months. Once open the pouch, the test should be used within 30min.

2.Study Objective

The objective of the study is to evaluate the consistency of the 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab produced by Beijing Applied Biological Technologies Co., Ltd (hereinafter referred to as XABT) with the comparison reagent.

3.Trial management

Before assessment, the technical staff of XABT and the researchers made discussions together to formulate the clinical study protocol, implemented in strict accordance with the study protocol, and agreed to clarify the objectives, contents and duties of both parties.

The researchers participating in the assessment had received technical training, and they were scientific researchers with high qualifications and rich experience.

The assessment samples and related data were managed by designated personnel. The data were archived in a computer in multiple copies.

Any other situation not specified in the protocol and occurring during the assessment was resolved by the two parties after consultation.

4.Study Design

4.1 Overall trial design and protocol

This clinical trial was designed to compare with the comparison reagent to evaluate the consistency. The anterior nasal swab specimens will be included in the trial， both

the samples will be tested by the two methods and analysis the test data to evaluate the consistency.

4.2 Sample Group

The samples are classified into two groups which are positive group and the negative group. Meanwhile, the samples shall be tested via the investigational reagent, and then compare the test results of the product with the comparison method and perform statistical analysis.The study was expected to test a total 440 samples.

4.3 Sample inclusion criteria, exclusion criteria, and rejection criteria

1） Inclusion criteria

①Samples from confirmed or suspected cases of novel coronavirus pneumonia, or with pneumonia, close contact, fever and other relevant symptoms;

②Samples from confirmed cases and released/discharged cases with previously negative result in SARS-CoV-2 detection;

③Interfering samples (such as samples from patients carrying influenza virus, respiratorysyncytial virus, rhinovirus, etc.);

④At all ages, male or female (try to cover all age groups);

2）Exclusion criteria

①Sample collection, shipment and storage do not meet relevant requirements;

②Samples contaminated or with an insufficient size;

③Other nonconforming samples considered by the principal investigator.

3） Rejection criteria:

①Sample collection, shipment and storage do not meet the requirements; the trial cannot be completed due to various reasons.

②Abnormal experimental results occur for unexpected reasons , such as the test cassette failure and operating errors.

③The concentration of interfering substances in the sample is beyond the product requirements, leading to abnormal clinical data.

④Other factors recognized by the principal investigator.

4.4 Sample collection, sample handling and preservation

Sample collection:

Put the swab into one nostril. The swab tip should be inserted no less than 2.5 cm (1 inch) from the edge of the nostril. Roll swab at least 3 times along the mucosa inside the nostril. Leave swab in the nostril for several seconds. Using the same swab, repeat this process for the other nostril. Withdraw swab from the nasal cavity.(Caution: This may feel uncomfortable. Do not insert the swab any deeper if you feel strong resistance or pain.)

Sample handling:

Insert the swab into the extraction tube which contains the extraction reagent. Rotate the swab inside the tube using a circular motion to roll the side of the extraction tube so that the solution is expressed and reabsorbed from the swab. Pinch the extraction tube with fingers and elute the liquid on the swab as far as possible into the extraction reagent, then pull out the swab. The extracted solution will be used as test specimen.

4.5 Experiment method

To test the clinical samples using both investigational reagent and the comparison reagent, record the test result. To evaluate the consistency of the test results between the investigational reagent and the comparison method.

The test operation is carried out in strict accordance with the respective instructions.

4.6 Quality control method

Laboratory quality control shall follow the quality control requirements of clinical institutions and departments to ensure the standardization of the clinical trial process.

Quality control before analysis: Check whether the sample collection and processing meet requirements and whether the sample information is complete and traceable.

Quality control should be performed in accordance with the requirements of the instructions of the evaluated reagent and Predicate device to ensure that the reagents

are under effective quality control and ensure the accuracy and repeatability of the test data.

4.7 Statistical analysis methods for clinical trial data

Statistical methods: the positive coincidence rate, negative coincidence rate, clinical sensitivity, clinical specificity, overall coincidence rate and 95% confidence interval of the qualitative detection results of the evaluated reagent were summarized in the form of four-grid table, the qualitative detection results of the two methods were summarized in the form of four-grid table, and Kappa test (consistency test) was performed on the qualitative results to verify the consistency of the qualitative results of the consistency with the clinical diagnosis/exclusion results.

Four-grid table statistics

Fill in the test results in the form of the following four-grid table, calculate the positive coincidence rate, negative coincidence rate, overall coincidence rate and 95% confidence interval of the results of the evaluated reagent and the Predicate device, and calculate the clinical sensitivity, clinical specificity and 95% confidence interval of the evaluated reagent detection result and clinical diagnosis/exclusion result, expressed using the following formula:

Investigational Reagent	**Comparison Result**		
	Positive	Negative	Total
Positive	a	b	a+b
Negative	c	d	c+d
Total	a+c	b+d	n (a+b+c+d)

a is true positive, b is false positive, c is false negative, and d is true negative

Positive coincidence rate / clinical sensitivity = a/(a+c)×100% (95%CI)

Negative coincidence rate / clinical specificity = d/(b+d)×100%(95%CI)

Overall coincidence rate = (a+d)/(a+b+c+d)×100%(95%CI)

Kappa test (consistency test)

To test whether there are consistency, equivalence or difference among evaluated reagent and the comparison method, the evaluated reagent and clinical diagnosis/exclusion result have consistency, equivalence or difference in the test result for a same sample, a statistical software will be used to calculate the Kappa value to make statistical analysis of the test result, and it will be significant for determining the consistency only when the Kappa value is 0-1. The higher the Kappa value, the better the consistency. It is generally considered that when the Kappa value is ≥0.75, they are highly consistent, and the two reagent systems are equivalent. If the Kappa value is <0.4, the two reagent systems are considered to be inconsistent, and further clinical validation is required.

2. Materials for the Study

Investigational reagent: 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab

Manufacturer: Beijing Applied Biological Technologies Co., Ltd.

Comparison reagent: Vitassay qPCR SARS-CoV-2 CE-approved

Manufacturer: Vitassay Healthcare S.L.U.

Table 1 Materials for the study

Product name	Manufacturer	**Lot No.**	**Expiry date**
2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab	XABT	E20210608	2023-06-01
Vitassay qPCR SARS-CoV-2	Vitassay Healthcare S.L.U.	11046-416	2023-02-28
Nucleic acid extraction Kit	GeneProof crobee 201A	2027617	2022-03

6.Clinical Results and Analysis

6.1 Basic characteristics of subjects

A total of 440 subjects were enrolled in this trial, including 203 males and 237females. The specific results are shown in below table.

Table 2 Basic information of subjects

Observation indicators	Amount	Positive Numbers	Negative Numbers
Gender	440	210	230
Male	203	105	98
Female	237	105	132
Age,（Years old）	Amount	Positive Numbers	Negative Numbers
1-10Y (including 10)	15	4	11
11-20Y (including 20)	54	9	45
21-30Y (including 30)	68	41	27
31-40Y (including 40)	59	38	21
41-50Y (including 50)	78	44	34
51-60Y (including 60)	54	30	24
61-70Y (including 70)	61	28	33
71-80Y (including 80)	28	7	21
81-90Y (including 90)	21	7	14
>90Y	2	2	0
Minimum - maximum	1-94 years old		

6.2 Clinical evaluation results

Total 220 positive and 220 negative samples were tested. The result showed in below table.

The positive consistent rate is 95.45% (91.80%-97.80%) and the negative consistent rate is 100.00% (98.34% -100.00%). Total consistent rate is 97.73 % (95.86% -98.90%)。

Table 3: Test Group Divided by Ct Value

Group	Ct of ORF gene	Amounts of samples
High/Medium Positive	Ct≤ 25	153
Medium/Low Positive	25<Ct≤30	47
Low Positive	Ct>30	20
Negative	Not detected.	220

Table 4: Result Analysis

Investigational Reagent		Comparison reagent		total
		Positive	Negative	
2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab	Positive	210	0	210
	Negative	10	220	230
total		220	220	440

The evaluated reagent detection results are as follows:

Positive consistent rate = 95.45% (91.80%-97.80%)*

Negative consistent rate = 100.00% (98.34% -100.00%)*

Total consistent rate =97.73 % (95.86% -98.90%)*

*95% Confidence Interval

Kappa value = 0.955, indicating that the evaluated reagent detection results and the comparison results were in good consistency.

7.Study Conclusion

The comparison study was conducted using 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab and the Vitassay qPCR SARS-CoV-2 RT-PCR, the results : the positive consistent rate is 95.45% (91.80%-97.80%)and the negative consistent rate is 100.00% (98.34% -100.00%),total consistent rate is 97.73 % (95.86% -98.90%).

Indicating a good consistency with the comparison product. Shows that the 2019-nCoV Antigen Rapid Test Cassette Anterior Nasal Swab can meet the clinical needs.
